# Intro to Signals

Lecture 6

Jan 25 2017

# Introduction

- ❑ A **signal** is a mechanism for notifying a process that an event has occurred.
  - ❑ When a signal is sent to a process is normal execution is interrupted
- ❑ Events can arise from executing an instruction in the process's instruction stream
  - ❑ Illegal instruction e.g., divide by zero
  - ❑ Illegal address e.g., accessing  $A[11]$  when there is no  $A[11]$

Even illegal instructions send signals,  
when they receive signals they must take actions

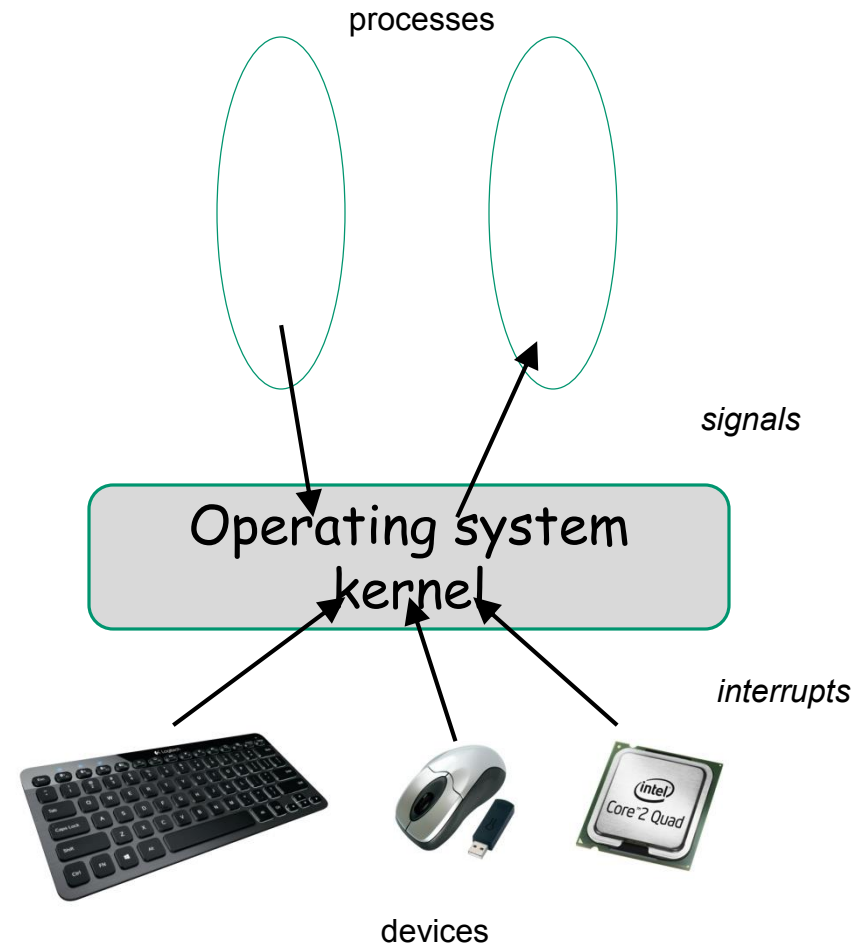

# Introduction

kill -l cmd in linux will give you all the different signals types

- ❑ Events occur at any time and come from an external source
  - ❑ may be unrelated to the execution of the process
  - ❑ e.g., `ctrl-D`, `ctrl-C`, `ctrl-Z`
- ❑ Upon receipt of a signal a process may take some action
  - already defined by your operating system
  - ❑ Take a default action; or
  - ❑ Use a pre-defined signal handler

# Introduction

- ❑ Signal sending:
  - ❑ OS kernel updates info for destination process
- ❑ Signal receiving:
  - ❑ kernel forces target process to handle signal
- ❑ A process can block some signals

# Dealing with Signals

- ❑ Each signal type has a system-defined default action.
  - ❑ abort and dump core (SIGSEGV, SIGBUS, etc.)
  - ❑ ignore, stop, exit, continue
- ❑ A process may choose to block or ignore some signal types.

# Dealing with Signals: Actions

- ❑ There are different actions that a process may choose to deal with a signal
  - ❑ Ignore
    - ❑ Exceptions: SIGKILL and SIGSTOP
  - ❑ Default
    - ❑ Different for different signals
  - ❑ Programmer-specified handler
    - ❑ Used instead of default

# Example

```
int alarmflag=0;
alarmHandler ()
{  printf("An alarm clock signal was received\n");
   alarmflag = 1;
}
```

```
main()
{
```

Sets up signal  
handler

```
    signal (SIGALRM, alarmHandler);
    alarm(3);
```

Instructs OS  
kernel to  
send SIGALRM  
in  
3 seconds

```
    printf("Alarm has been set\n");
    while (!alarmflag) pause ();
```

Suspends caller  
until signal

```
    printf("Back from alarm signal handler\n");
```

```
}
```

# Signal Handling

- ❑ The system call `signal` captures a specific function and associates it with a programmer-defined function
- ❑ To use the `signal` system call requires that you include `signal.h`
- ❑ The form of the `signal` system call does vary across different versions of Linux/Unix

# Important Signals

- ❑ SIGINT

- ❑ Interrupt signal from terminal (ctrl-c)

- ❑ SIGTSTP

- ❑ Stop signal from terminal (ctrl-z)

- ❑ SIGCHLD

- ❑ A child process has stopped or terminated
